Introduction

- Student **motivation** and **interest** important non-cognitive components of performance in tutoring environments
- Finding ways to **activate** and **sustain** the development of interest has the potential to enhance students' learning in these environments (Walkington & Bernacki, in press)
- Different students have different needs, dependent upon **prior knowledge** (Mayer, 2001) and **attitudes** (Walkington et al., 2013)
- A better understanding of how cognitive and non-cognitive factors interact as students solve problems can offer guidance for efforts to **personalize** learning

CHANGING MINDS

Comprehending Story Texts

- In order to solve story problems, learners must comprehend problem text (Kintsch & Greeno, 1985)
- Successful problem-solvers coordinate:
 - **Surface model:** Literal text
 - **Textbase:** Info arranged in propositional form
 - **Situation model:** Understanding of actions and relationships
 - **Problem model:** Formal equations and operands
- The *readability level* and *topic* of problems may interact with cognitive and non-cognitive factors

Nathan, Kintsch, &
Young (1992)

CHANGING MINDS

Theoretical Framework – Cognitive Factors

- **Cognitive Load** (Sweller, Merrienboer, & Paas, 1998):
 - A story that is easier to read may reduce extraneous cognitive load, freeing up resources for germane processing
 - A story that is familiar may provide grounding (Koedinger et al., 2008):
 - Grounded representations are more easily accessed in long-term memory
 - Less prone to errors given redundant semantic elaborations in long-term memory that can be used to support or check inferences
- **Individual differences principle** (Mayer, 2001):
 - Design effects intended to reduce cognitive load more important for low-knowledge learners because high-knowledge learners can better compensate for less support

Theoretical Framework – Non-Cognitive Factors

- **Situational Interest**

- Spontaneous and transitory reaction to features of environment
- Can focus attention, promote persistence, and improve learning (Ainley, Hillman, & Hidi, 2002; Harackiewicz et al, 2008)
- Text characteristics associated with situational interest include: coherence, completeness, informational complexity, concreteness, ease of comprehension, imageability, suspense, importance/relevance of information, and identification with characters (Schraw & Lehman, 2001)
- Texts that are **more readable** (i.e., more coherent and less complex) may activate situational interest, depending on background of learner
- Texts that are connected to **personally relevant topics** may also activate situational interest
- Effects of situational interest interventions vary based on attitudes towards math (e.g., Bernacki & Walkington, 2014; Durik & Harackiewicz, 2006)

Readability of Story Problems

- Research has shown that reading skill is a strong predictor of performance on math story problems (Kyattla & Bjorn, 2013)
- Research has not successfully linked traditional readability measures (words, syllables, etc.) to mathematics performance (Wiest, 2003)
- Research on text comprehension outside of mathematics suggests that many characteristics influence readability at the surface (wording and syntax), textbase (explicit ideas), and situation model (meaningful representation) levels (Graesser & McNamara, 2011)

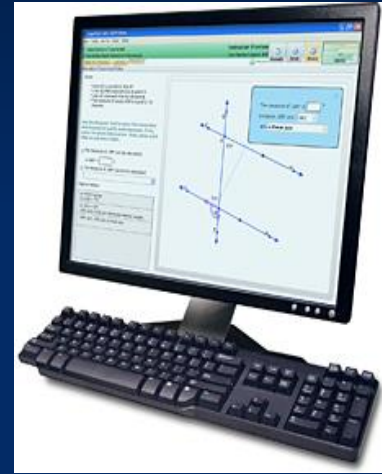

Topics of Story Problems

- Some problem topics may be more or less familiar to students
 - Urban students in the South solving problems about shoveling snow or building a greenhouse (Walkington, 2010)
- Matching problem topics to students' interests and experiences (i.e., **context personalization**) can improve both immediate performance and long term learning in mathematics (Walkington, 2013)

Research Questions

- **RQ1**: How are quantitative measures of **text readability** associated with performance on math story problems?
- **RQ2**: How are quantitative measures of **topic incidence** associated with performance on math story problems?
- **Two contexts**: ITS and standardized tests

Readability: Coh-Metrix

- Provides 108 quantitative measures of (McNamara et al., in-press):
 - **Surface code**: Difficulty of words and syntax
 - **Textbase**: Ease of connecting different ideas in the text
 - **Situation model**: Consistency of various dimensions of the mental representation of the text such as causation, time, and space

Coh-Metrix

Department of Psychology, University of Memphis,
Memphis, TN-38152

Coh-Metrix calculates the coherence of texts on a wide range of measures. It replaces common readability formulas by applying the latest in computational linguistics and linking this to the latest research in psycholinguistics.

CHANGING MINDS

Topic Incidence - LiWC

- Dictionary-based text analysis program (Pennebaker, Chung, Ireland, Gonzales, & Booth, 2007)
- The topic of a story problem was determined by whether it had at least one word that fell in one of the LIWC topics or sub-topics

| LIWC Topics | LIWC Sub-Topics |
|-------------------|---|
| Social | family, friends, people |
| Affective | positive emotions and negative emotions |
| Biological | body, health, ingestion |
| Cognitive | insight, causation, discrepancy, tentativeness, certainty, inhibition, in/exclusiveness |
| Perceptual | see, hear, feel |
| Relativity | motion, space, time |
| Personal | work, achievement, leisure, home, money, religion, death |

Study 1: Participants

- 9 high schools and 1 middle school using Cognitive Tutor Algebra (CTA) curriculum ($N = 3394$ students)

| School Characteristic | Schools in Sample |
|-----------------------|--|
| Geographic Location | 10 different states, 2 rural, 4 urban, and 2 suburban |
| F/R Lunch % | 3 had 0-33% of students eligible, 4 had 33-66% eligible, 2 had 66-100% eligible |
| Race/Ethnicity | 5 predominately White , 3 predominantly African-American, 2 predominately Hispanic |
| Achievement Level | 3 had under 50% of students proficient, and 3 had 80% or more proficient, 4 in between |

Study 1: Environment

The screenshot shows a software interface for a math course. The title bar reads "File Tutor Go To View Help". The main header is "8 - Linear Models and Independent Variables" with a sub-header "1 - Finding Independent Variables with Positive Rates of Change". There are navigation buttons for "Table of Contents", "Lesson", and "Problems". On the right, there are buttons for "Instructor Preview", "Example", "Hint", "Done", and "Skills".

The "Scenario" pane on the left contains the following text:
You have just been promoted to assistant manager at PAT-E-OH Furniture Inc. and have received a raise to \$10.50 per hour.
1. How much would you be paid if you worked five hours?
2. How much would you be paid if you worked 10 and 1/2 hours? If you have not already done so, please fill in the expression row with an algebraic expression for the total pay. Then use the expression and the Solver to answer questions 3 and 4 below.
3. How many hours must you work to make five hundred fifty dollars?
4. In order to make \$2,200.00, how many hours must you work?
To write the expression, define a variable for the time worked and use this variable to write a rule for your total pay.

The "Worksheet" pane on the right contains a table for data entry and an "Answer Key" table.

| Quantity Name | | |
|---------------|--|--|
| Unit | | |
| Expression | | |
| Question 1 | | |
| Question 2 | | |
| Question 3 | | |
| Question 4 | | |

Answer Key:

| Quantity Name | the time worked | the money earned |
|---------------|-----------------|------------------|
| Unit | hour | dollar |
| Expression | X | 10.5X |
| Question 1 | 5 | 52.5 |
| Question 2 | 10.5 | 110.25 |
| Question 3 | 52.381 | 550 |
| Question 4 | 209.5238 | 2200 |

Data collected from the first 8 units in CTA on linear functions – 151 unique story problems

Study 1: Analysis Techniques

- Logistic regression models predicting: **Correct**, **Hint**, **Incorrect**
- (Linear regression model predicting: **Latency**)
- Tested only readability/topic indicators with significant correlations to one or more of outcomes
- Sample size was **$N = 151$ problems** - each problem's performance measures were averaged for all students who solved that problem
- Random effects to control for mathematical aspects of problem, as well as for student effects
- Predictors tested for inclusion using Chi-Square test for significant reductions in deviance of the model
- **Three models**: All problems, expression-writing, and low schools

Study 1: Results

- **Moving from 3 to 4 sentences** reduced corrects by an estimated 4.4% ($p < .01$), increased incorrects by an estimated 2.75% ($p < .05$) and increased hints by an estimated 1.4% ($p < .01$)
 - Other measures of length (DESWC, DESSL) sometimes significant as well.
- **Third person singular pronouns** (3PS; he/she/it) associated with more correct answers ($p < .05$) and fewer hints ($p < .01$)
 - Changing a problem with no 3PS to a problem that has 10% of its words as 3PS should increase correct answers by an estimated 3.6%
- Increasing the **standard deviation of the amount of semantic overlap between sentences** significantly decreased correct answers
 - Moving from SD = 0 to SD = 0.3 would decrease corrects by 4%
- Using **concrete words** significantly reduced hints (*low schools only*)
- Using **words with multiple meanings** (word polysemy) significantly decreased corrects and increased incorrects (*expression-writing only*)
 - Each additional meaning decreases corrects by 4.6% and increases incorrects by 4.6%

Study 1: Results

| Category | High Example | Low Example |
|---|--|---|
| Standard deviation of overlap of adjacent sentences | Ms. Williamson woke up one morning to find her basement flooded with water. She called two different plumbers to get their rates. The first plumber charges \$75 just to walk in the door plus \$25 an hour. The second plumber charges a flat \$40 an hour. (SD of overlap = 0.375) | You have just become CEO (Chief Executive Officer) of a company that is heavily in debt. The company's balance sheet currently shows a balance of -\$525000. The company is paying the debt off at the rate of \$12500 per month. (SD of overlap = 0.025) |
| Word polysemy | An open <u>pit</u> copper <u>mine</u> is 1550 feet deep and the company estimates that it is getting deeper at the rate of seven <u>feet</u> per month. Assume the number of feet below the surface is a negative number. (Average number of meanings of each content word = 6.375) | On Tuesday morning at 7 AM the residents of Bar Harbor Maine awoke to six inches of snow on the ground. The snow fell at the average rate of one-half inch per hour during the storm. (Average number of meanings of each content word = 2.342) |

Study 1: Results

- Words involving **social processes** decrease incorrect answers ($p < .05$) by an estimated 2.09%
 - References to family, friends, humans, socializing, speaking, having parties, making calls, sending messages
- **Work words** decrease corrects ($p < .05$) by an estimated 1.89%
- **Motion words** decrease corrects ($p < .05$) by an estimated 2.03%
- **Healthcare words** increase hints ($p < .01$) by an estimated 1.63%
- Inhibition words (**saving money**) increase hints ($p < .05$) by an estimated 0.98%

Study 1: Results

| Topic | Example Problem |
|-------------------|---|
| Social | A bride is making nameplates to put on the tables at her reception. She can make them at the rate of 25 per hour. She works for two hours and quits for the night realizing that she cannot complete this many nameplates herself. The next day she calls her mother and they both work together. Her mother can make 35 nameplates per hour. |
| Work | You have just been promoted to assistant manager at PAT-E-OH Furniture Inc. and have received a raise to \$10.50 per hour. |
| Motion | A machine called the Crawler which moves space shuttles travels at the rate of 29 feet per second. The Crawler is currently 100 feet from the hanger moving toward the launching pad. |
| Health | According to the American Heart Association approximately 145000 women die every year from smoking-related diseases. In fact lung cancer has become the leading cause of cancer death among women. |
| Inhibition | During the school year teachers save money for use during the summer when they're not being paid. This year due to some unexpected expenses one teacher was able to save only \$879. He figures he will need \$23 a day for personal spending money. |

Study 1: Replication

- Eighth grade students solving $N = 60$ MATHia problems on linear functions
- Coh-Metrix:
 - Results replicate, except **length** (limited problem set) and **word polysemy**
- LIWC:
 - Not enough non-social contexts to replicate that finding, but **home** references associated with higher performance
 - **Work** contexts associated with lower performance
 - **Motion** finding does not replicate

Study 1: Discussion

- **Good** for problem solving performance: Shorter stories, concrete words, third person singular pronouns, social contexts
- **Bad** for problem solving performance: Longer stories, stories with inconsistent overlap, words with multiple meanings, healthcare, business, financial, or physics contexts
- **Effect sizes are small** – ΔR^2 -like measures fall between 5 and 15% typically; individual correlations around 0.2
- Makes sense that **student** characteristics and **mathematical** characteristics of the problem should explain most of performance

CHANGING MINDS

Study 2: Design

- Conducted Coh-Matrix/LIWC analyses on 700 released 4th and 8th grade NAEP mathematics items
- ~2 million U.S. students have taken the NAEP since 1996
- Looked at only items that had at least 1 sentence worth of words; predictors to control for:
 - Presence of visuals in the question or in the answer choices
 - Multiple choice or short constructed response
 - Grade level
 - Mathematical topic area
 - Difficulty (Easy, Medium, Hard) and Complexity (Procedural, Conceptual, Problem-solving)
 - Whether answer choices were words or numbers
 - Whether problem was in a “real world” context
 - Availability of calculator and manipulatives

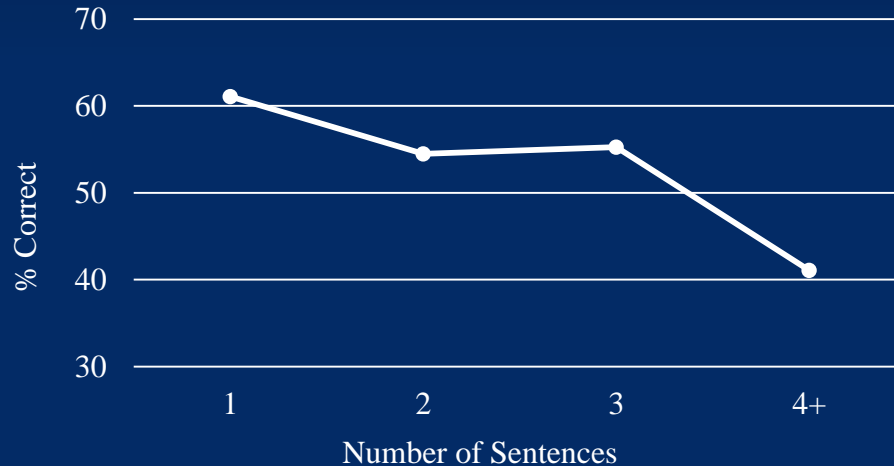

SMU

ANNETTE CALDWELL SIMMONS
SCHOOL OF EDUCATION
& HUMAN DEVELOPMENT

CHANGING MINDS

Study 2: Results

- Readability/Topic measures may be less important on standardized tests
- However, length still important:

SMU

ANNETTE CALDWELL SIMMONS
SCHOOL OF EDUCATION
& HUMAN DEVELOPMENT

CHANGING MINDS

Study 2: Results

- **Readability measures:**
 - More sentences (4+) associated with lower performance
 - Longer sentences associated with lower performance (*4th grade only*)
 - Second-person pronouns associated with lower performance
 - Other pronouns associated with higher performance
 - Word acquired later in life associated with lower performance
- **Topic measures:**
 - Insight words (think, know, consider) associated with lower performance
 - Leisure words associated with higher performance (*4th grade only*)
 - Problems in real world contexts were easier than other word problems
 - Current: Recoding topics of problem topics by hand

Upcoming Analyses

- Look at how NAEP study results vary by student background characteristics and problem characteristics
- Conduct similar analyses with TIMSS released items
- Look at which readability/topic factors predict differences in TIMSS item performance between U.S. and other groups of countries

SMU.

ANNETTE CALDWELL SIMMONS
SCHOOL OF EDUCATION
& HUMAN DEVELOPMENT

CHANGING MINDS

Discussion

- Within a mathematics curriculum, measures relating to surface model (word difficulty), textbase (length, overlap, pronouns), and situation model (topics) are all associated with performance
- Within a standardized math test, only surface model (word difficulty) and textbase (length, pronouns) measures seem to have significance
- **Cognitive load** may be of paramount concern on standardized tests, with little opportunity to elicit or maintain **situational interest** through interesting problem topics and concrete, relevant language

SMU

ANNETTE CALDWELL SIMMONS
SCHOOL OF EDUCATION
& HUMAN DEVELOPMENT

CHANGING MINDS

Implications

- In algebra, need to learn to navigate complex and potentially lengthy story contexts on diverse array of real world/professional topics
- To introduce and provide access to **new, challenging ideas**, readability and topic findings can be taken into account by problem designers
- Personalization/adaptation to learner needs:
 - **Struggling with a concept**: Simple, readable problems in interesting and accessible real world contexts
 - **Some mastery of concept**: Some factors of difficulty relating to readability present in most problems; mix of interesting and dry/application contexts
 - **Full mastery of concept**: Completely abstract/symbolic problems or challenging story problems with high-level language in contexts of authentic application

SMU

ANNETTE CALDWELL SIMMONS
SCHOOL OF EDUCATION
& HUMAN DEVELOPMENT

CHANGING MINDS

Next Steps

- Intervene on readability measures – all findings are strictly correlational
 - *ASSISTments* platform?
- Several studies show intervening on topic measures is effective for promoting interest and learning (Walkington, 2013; Bernacki & Walkington, 2014), with additional studies underway
