

# STW Water Process & Technologies

*A Subsidiary of STW Resources Holding*

*“A Water Solutions Company”*

OTCQB: STWS

# *STW Water Process & Technologies*

## *“Capabilities for Municipal & Industrial Applications”*

**STW WATER CAPABILITIES:** STW assesses the customer's water processing needs and oversees all project phases including; Analysis, Regulatory, Technology, Implementation and Operation. STW's business model provides consultation services, full process design & engineering, fabrication, installation & commissioning, training, on-going operation & full maintenance, troubleshooting, repairs and other services.

**STW BUSINESS MODEL:** STW Water will design, build, own and operate water systems for some customers simply offering our reclamation and water management services. NO capital expense to our Customers for our systems. STW will process water for a fee per 1,000 gallons.

**STW provides industry leading patented technologies with Texas based Manufacturing Partners:**

- **DESALINATION:** Brackish water, High brackish water or Seawater or Geothermal Water: STW's DyVaR system combined with a Hybrid high brackish high recovery or Seawater Reverse Osmosis System or the water from geothermal operations will have no environmentally sensitive concentrated brine reject discharged into the local waterways.
- **ZERO LIQUID DISCHARGE:** STW DyVar technology is a Zero Liquid Discharge system capable for 95%+ of the fresh water recovery in the process.
- **TOILET TO TAP TECHNOLOGY:** STW's Toilet to Tap technology with its advanced pre-treatment process combined with Hybrid high brackish high recovery or Seawater Reverse Osmosis System is capable to purify contaminated water with variety of complex water quality thereby preventing fouling attacks on membranes & allowing reliable operation with significantly reduced operating expenses and decreased power consumption.
- **NEW EMERGING TECHNOLOGY:** STW with its manufacturing partner is developing patent process design capable to remove all contaminants in water but chlorides (hardness, sulfates, TSS, hydrocarbons) along with a patent process design for leachate removal. These patented processes will be highly beneficial to oil & gas market for water reclamation and reuse.

# Processing and Zero Liquid Discharge of Seawater, Brackish Water, Flowback & Produced Water

STW/Salttech  
Midland, Texas

# Salttech DyVaR Desalination Solution

This system is currently operating in West Texas processing brackish water for a municipality

## DyVaR Process Flow

**ENVIRONMENTAL BENEFITS:** If the STW/Salttech DyVaR Technology is placed inline with a Seawater Desalination System or used with a Geothermal Operation, there will be NO potentially environmentally sensitive brine concentrate discharged into the local waterways since the system is Zero Liquid Discharge and 93-97% of the fresh water is recovered in the process. The waste stream is salt crystals and minerals.

# STW/Salttech Technology: Dynamic Vapor Recompression (DyVaR) DESALINATION TECHNOLOGY

- DyVaR applicable for all kinds of highly concentrated fluids
  - Removes Total Dissolved Solids (TDS)
  - Removes Hardness
  - Removes TSS
  - Removes Volatiles
  - Disinfection technology
- DyVaR is a **modular system**
- DyVaR uses **no chemicals**,
- DyVaR uses **no membranes**
- DyVaR requires **no pretreatment**
- DyVaR requires little operator attention
- DyVaR has very high energy efficiency
- DyVaR is **insensitive to scaling or fouling**
- DyVaR is designed for continuous operation

- **ENVIRONMENTAL IMPACT:** If placed inline with a Seawater RO System or used with a geothermal operation, there will be no potentially environmentally sensitive brine concentrate discharged into the local waterways since the system is Zero Liquid Discharge and 93-97%+ of the fresh water is recovered in the process. The waste stream is salt crystals and minerals.

# Crystallization

Utilizing the DyVaR system, it is possible to concentrate any saline liquid to a crystallization level. It is also possible to create a 10# Brine liquid.

**Ultra Low Scaling** - In comparison to other evaporation technologies, any scaling effects in the DyVaR system will be mitigated since boiling place in the individual DyVaR modules and not in the heat exchanger. The re-circulation rate combined with the velocity of the re-circulating liquid is so high that any formed crystal will be removed by the force of the liquid itself.

**No Chemicals or Filters Used** - Footprint for a 3,000 bbl/day system is approximately 30' x 40'  
Footprint for a 5,000 bbl/day system is approximately 50' x 80'

**Zero Liquid Discharge (ZLD)** - The two effluent streams are approximately 96+% fresh water and 10# Brine or salt crystals. If 10# brine is needed for drilling operations, the crystallized salt can be transported and mixed at the location for a lower cost than transporting liquid brine.

**Oil & Gas Produced and Flowback Water** - Will process up to 300,000 TDS water and reduce TDS and salt content to <200 TDS

## "DyVaR Systems Crystallization"

A Subsidiary of STW Resources Holding

- Positive and negative ions can combine into different molecules
- A molecule will form and crystallize when a super saturation of the positive and negative ions that make it up are present
- Salt molecules have different points of super saturation depending on for example: composition, temperature, pressure etc.

# STW Water Process & Technologies

## "DyVaR Systems Crystallization"

A Subsidiary of STW Resources Holding

- In order to maintain the desired 10 ppg density of the fluid with the provided legacy specs\*, the sodium chloride needs to be concentrated to its saturation point.
- To create a consistent brine, a concentration point is chosen just above the crystallization point of sodium chloride. This ensures that sodium chloride is optimally dissolved when it exits the unit. And any excess caused by fluctuations in the composition of the influent will precipitate.
- While concentrating the solution up to the saturation point of sodium chloride, a precipitation of Calcium sulphate and carbonate will occur because they become oversaturated at far lower concentrations.
- Solids can be removed from the brine stream through physical separation.

## DyVaR

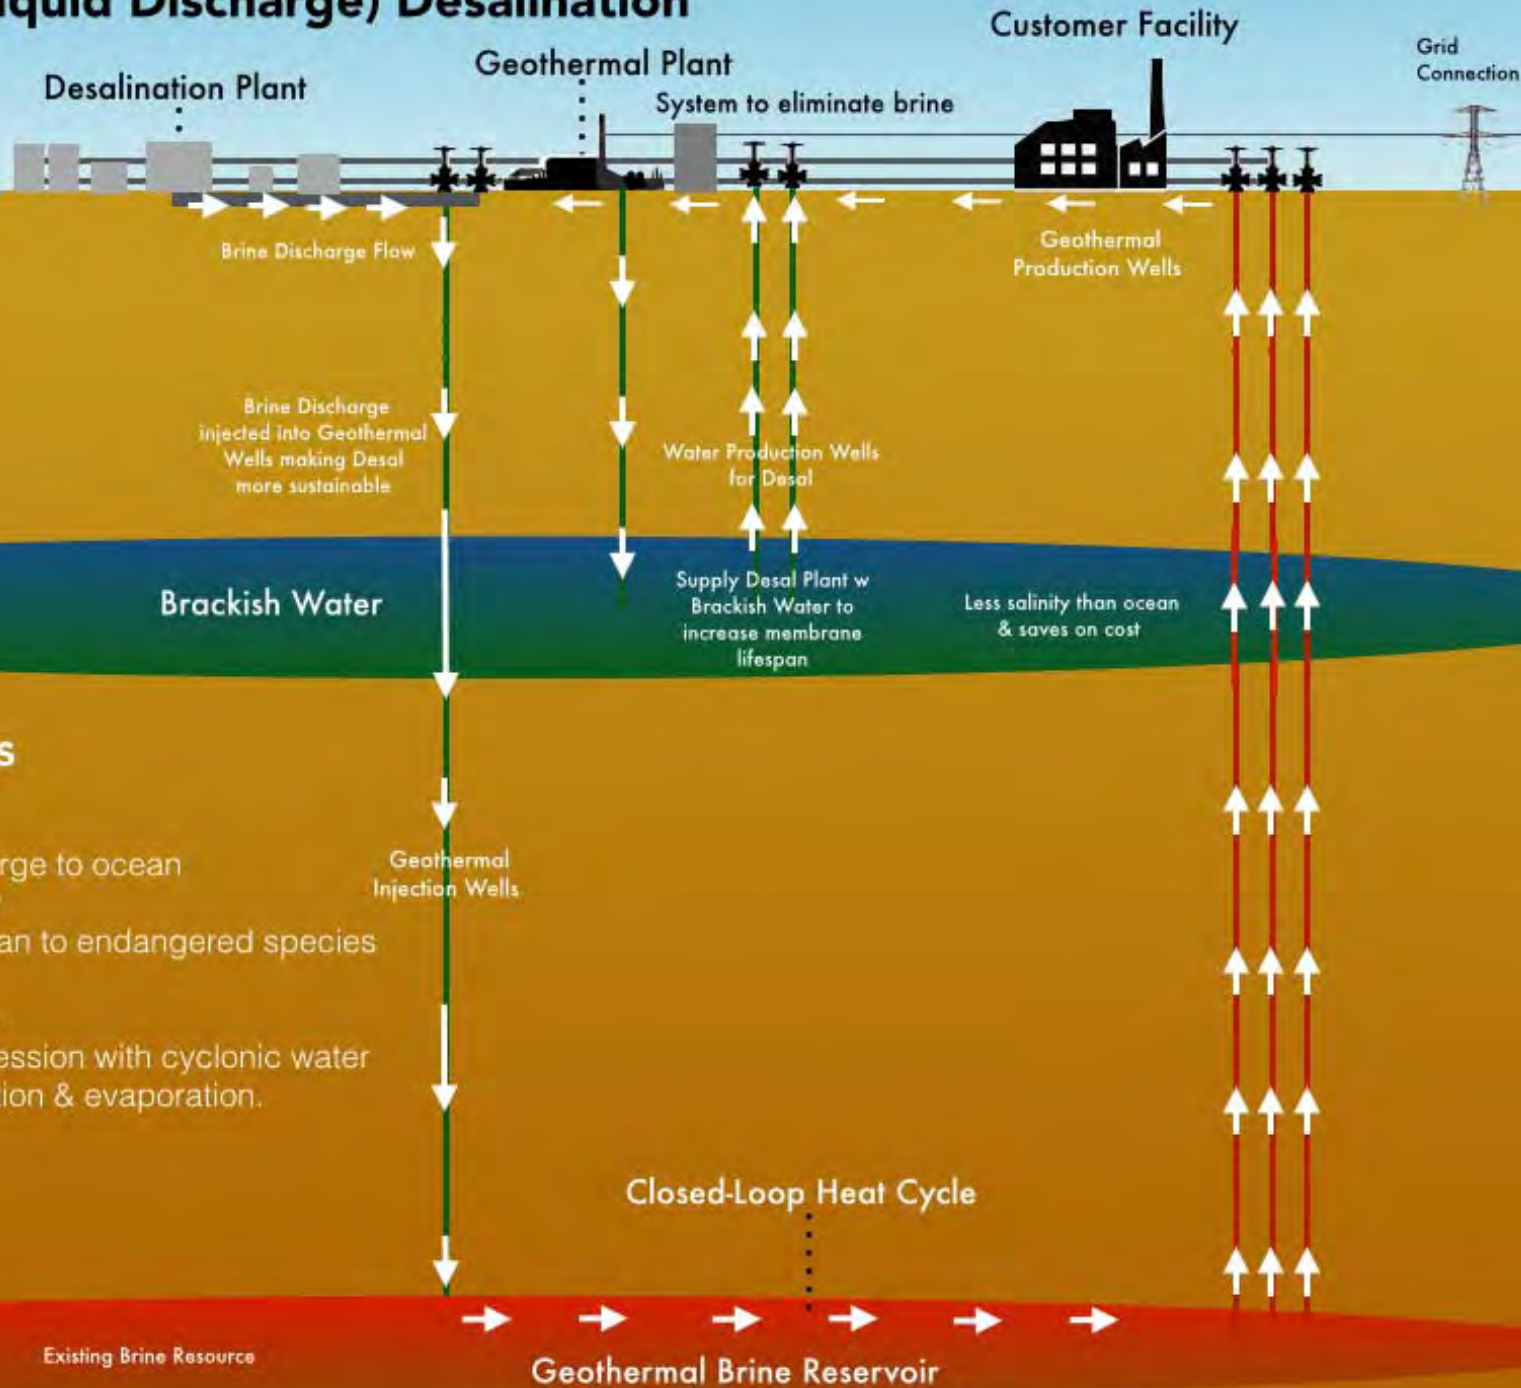

\*basics for this diagram are based on information of Royal Dutch Shell/Shell Oil

# Geothermal & (Zero Liquid Discharge) Desalination

Sustainability in design

## Zero discharge process

### Environmental Benefits

- Zero brine effluent discharge to ocean
- Very reliable water supply
- Diminished threats in ocean to endangered species from increased salinity
- STW Water DyVar System
- Dynamic Vapor Recompression with cyclonic water matrix - enhanced distillation & evaporation.

SUMMARY REPORT

10014 SCR 1213
Midland, Tx 79706
432-661-4184 Phone

Table with project details: STW Resources, Project: SaltTech, Project Number: BJ SWD 1, Project Manager: Alan Murphy, Sampling dates, and Reporting date.

Table with columns: LAB #, MATRIX, SAMPLE ID, Reporting Limit, 4I02011-03, 4I02011-04, and two empty columns.

General Chemistry Parameters by EPA / Standard Methods (Water)

Table of chemistry parameters: Total Alkalinity, Chloride, Specific Conductance (EC), Total Hardness, pH, Temperature, Total Dissolved Solids, Sulfate.

Total Metals by EPA / Standard Methods (Water)

Table of metal parameters: Barium, Calcium, Iron, Magnesium, Manganese, Sodium, Silica.

Special Notes

- 1 = Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
2 = Certification in process for this analyte.
